Summary

Product designer with 5 years of experience designing B2B SaaS platforms, mobile apps and Telegram Mini Apps. I own the full cycle, from user research and information architecture to design systems, handoff and design QA. Recent results: +10% paid conversion and +20% retention in a fitness app, -25% bounce rate and -40% missed orders in a restaurant SaaS. I use AI agents in Figma to automate layer naming, styles and UI-kit audits, which cut handoff time by 30%.

Experience

UX/UI Designer — PAIR

Jan 2026 – Sep 2026 · Digital production agency · Project: SCP LAB, a training app for athletes

- Increased paid subscription conversion by 10% by redesigning onboarding and moving the paywall to the end of the physical assessment, after users had seen value.
- Reduced time-to-value by 30% by building workout screens around a dominant video player and removing visual noise.
- Improved retention by 20% with a high-contrast, large-target interface built for gym conditions: sweaty hands, heavy breathing and screen glare.
- Cut design-to-development handoff time by 30% by introducing AI agents for layer naming, style generation and UI-kit consistency checks.
- Delivered 68 screens on a design system of 88 components, 47 styles and 59 variables.

UX/UI Designer — FoodBot

Feb 2025 – Jan 2026 · SaaS platform for building Telegram bots for restaurants and cafes

- Designed a 3-platform ecosystem from scratch, 320+ screens: landing page, web admin panel (174 screens) and a Telegram Mini App (150+ screens).

- Reduced bounce rate by 25% by simplifying the product architecture and turning a database-like interface into a visual builder.
- Cut bot setup time by 30% with step-by-step onboarding that turned complex technical flows, such as BotFather API setup, into linear scenarios.
- Lowered support load by 20% with contextual help triggers that answer common questions inside the interface.
- Reduced missed orders by 40% by launching a Mini App that lets owners manage orders and stop-lists on the go with instant notifications.
- Sped up development by 20% with a scalable design system and clean, developer-ready files (Auto Layout, variables, component structure).
- Used LLMs to cluster competitor reviews and documentation, and wrote a script to generate attention heatmaps for validating layouts.

UX/UI Designer — Industrial cable distributor (NDA)

Nov 2024 – Feb 2025 · Internal procurement tool for purchasing managers

- Interviewed purchasing managers and analysed support tickets for a team processing about 50 orders a day; identified three core gaps: no order registry with statuses, no visibility into supplier requests, no control of incomplete item lists.
- Mapped the end-to-end procurement journey and designed all scenario branches, including edge cases such as partially sent requests and long order lists.
- Built a design system with 74 icons, 36 button variants, and tables with 12 row states, cutting design time for new screens by 35%.
- Ran moderated usability tests on an AI-generated interactive prototype: 90% task success, with the error rate reduced from 10% to 7% after iteration.
- Reduced time to place an order by 35% and cut orders with unauthorised incomplete item lists by 90% through warnings and a visible item counter.

UX/UI Designer — E-commerce marketplace (NDA)

Feb 2024 – Nov 2024 · Seller dashboard

- Researched the business model and competitor seller dashboards, then interviewed sellers to map their daily tasks and prioritise key actions.
- Restructured the dashboard around actual usage: placed the top-5 best-sellers widget first after research showed it was the most visited section.
- Designed the information architecture, wireframes and key screens, validating the prototype with sellers before visual design.
- Designed empty and error states that tell sellers what to do next instead of showing a blank screen.

- Built the UI kit and design system, created an AI-assisted interactive browser prototype for user testing, and ran design reviews of the implemented screens.

UX/UI Designer — Mobile app studio (outsourcing for Chinese publishers)

May 2023 – Feb 2024 · Remote

- Designed 15+ iOS apps, each with a unique visual style and animations to meet App Store rules against duplicate apps.
- 12 of 15 apps passed App Store review on the first submission; the other 3 were approved on the second.
- Created motion design exported to Lottie JSON, so developers used animations directly instead of rebuilding them.
- Prepared annotated files for an international team, reducing development time by about 20% through fewer clarifications and rework.

Freelance UX/UI Designer

Nov 2021 – May 2023

- Designed websites end-to-end as a solo designer, from promo sites to corporate portals: competitor and audience research, user flows, responsive layouts, UI kits and handoff.
- Created custom interface animations, illustrations and marketing assets: landing pages, email campaigns, banners and ad creatives.

Skills

- **Research:** user interviews, customer development, competitor analysis, CJM, JTBD, usability testing, A/B testing, product metrics
- **Design:** information architecture, user flows, wireframing, prototyping, responsive design, interaction and motion design, WCAG accessibility
- **Design systems:** Figma components, variants, variables, Auto Layout, design tokens, documentation, developer handoff, design QA
- **Tools:** Figma, Framer, Adobe Photoshop, Claude, ChatGPT, Gemini, AI agents for Figma automation

Education

National Research Tomsk Polytechnic University — Higher education, 2021
